

CLUSTER C – ROLLING STOCK ASSET MANAGEMENT: ON-BOARD AND WAYSIDE TECHNOLOGIES

As part of the FP3–IAM4RAIL project, Cluster C plays a key role in transforming the way rolling stock maintenance is managed across Europe. It is focused on developing intelligent technologies that enable real-time monitoring of train conditions, both onboard and from strategically placed trackside systems.

The FP3 initiative aims to deliver integrated European solutions that reach Technology Readiness Level 6 (TRL 6), a stage where systems are demonstrated in real-world environments. Cluster C contributes to this goal by developing and validating technologies that are not only innovative but also ready for deployment.

These advancements are being showcased under Demonstration Objective 2 (DO2), which highlights how monitoring technologies can support informed decision-making and maintenance planning. This includes redirecting trains to workshops for scheduled or rescheduled interventions, using manual processes, and advanced automated inspection systems. The objective is to reach TRL 6 by 2025, ensuring that the solutions are proven in operational settings across Europe, not just theoretical.

DO2 of Cluster C FP3

What does Cluster C include?

Cluster C is structured around three interconnected work packages (WP5, WP6, WP7), each contributing to the development of a comprehensive, intelligent asset management system for rolling stock:

WP5: Rolling Stock (on-board): Data acquisition and monitoring technologies.

This package focuses on the development of advanced technologies for data acquisition and monitoring of rail vehicles. Its objective is to design, develop, validate, and implement condition-based maintenance (CBM) solutions using machine learning algorithms and digital tools. These solutions are intended to support railway maintainers, owners, and operators in the decision-making process. The objective is to reach a TRL of up to 6.

WP6: Rolling Stock (on-board): Data acquisition, monitoring technologies, asset prognosis and feedback into operational processes.

This work package focuses on the development of technologies for the monitoring of rolling stock assets from the track. The aim is to integrate previous achievements in the railway sector with regard to on-track monitoring and to develop new applied solutions for lines with cross-border and mixed traffic. It aims to create a more complete European railway control point, including the necessary inputs for its basic specifications. The objective is to achieve a TRL of 6/7.

WP7: European Railway Checkpoint for mixed traffic.

This work package performs preparatory actions for demonstrations of the feasibility of proposed technical solutions and preparatory work for fully integrated demonstrators under operational conditions. It also compiles preparatory work in digital environments to achieve intermediate state demonstrators at component/subsystem or system level. The objective is to achieve a TRL of 6.

Discovering Cluster C Use Cases

Cluster C's technologies are being tested in real-world use cases (UCs) across multiple European countries. These pilots are essential to validate the solutions under operational conditions and gather key data for future deployment.

UC ID	Title	Leader	Relevant WP/DO
5.1	Bogie Monitoring System (on-board)	ATSA	WP5/WP6/DO2
5.2	Health Monitoring & Analytics of HVAC & Brakes systems	KB	WP5/WP6/DO2
5.3	Health Monitoring & Analytics of HVAC, Sanitary Systems & Brakes	KB	WP5/WP6/DO2
5.4	Health Monitoring & Analytics and ML algorithms development of Traction, HVAC, Doors, Batteries & Brakes	FT	WP5/WP6/DO2
5.5	Health Monitoring & Analytics and ML algorithms development of Traction, HVAC, Doors, Batteries, Brakes & auxiliary system	CAF	WP5/WP6/DO2
6.1	Development of next generation Traction control unit hardware and gate drive communication link	ATSA	WP6/DO2
6.2	Traction Component Health Monitoring & predictive Maintenance	ATSA	WP6/DO2
6.3	Set up of adaptive wireless telecom network between train elements	SNCF	WP6/DO2
6.4	Adhesion estimation for management	PRORAIL	WP6/DO2
6.5	Wayside signalling equipment monitoring system	TALGO	WP6/DO2
6.6	On-board bogie diagnostic solution for fault detection applied to train(s) operating in Germany	SMO	WP6/DO2
6.7	Digital twin for energy	CAF	WP6/DO2
6.8	Smart maintenance scheduling tool	CAF	WP6/DO2

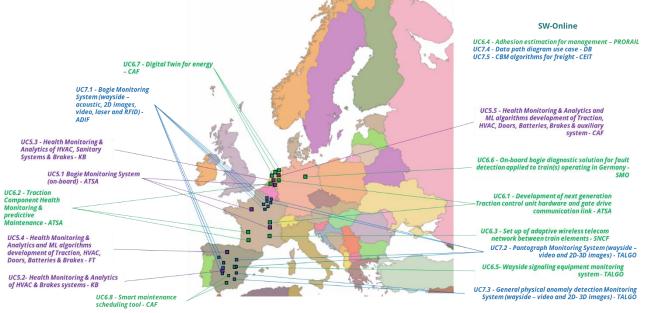

Let's explore the UCs that are revolutionizing rail rolling stock maintenance and efficiency:

June 2025
